

Installation Instructions for JSciCalc:

For Windows Platform:

The installer file is JSciCalc.exe. Run it, it will ask for the location to save the files. On choosing the location, it creates a folder called JSciCalc which contains a JSciCalc.jar file which is the file needed to run the program. Java Runtime Environment is required to be able to run the program(version 1.5.0 or later is recommended.) It also contains a folder named Source Code which contains the source code for the program. The JSciCalc-Introduction.pdf file provides a list of features of the calculator and some general information. The Operating Instructions.pdf file provides a list of instructions to correctly operate the software. The Objectives.pdf file lists the objectives, keeping which in mind this software has been developed. Requirements.pdf lists the minimum system requirements to run the software. The files Help.dat and GraphHelp.dat are necessary for the Calculator's in-

built help functionality, so do not delete them at any cost, and keep all the files at the same location. If you are changing the location of JSciCalc.jar in your computer, then also shift the 2 help files and keep them in the same folder as JSciCalc.jar.

For Linux Platform:

Just extract the JSciCalc.jar file into the desired folder in Linux and run it. Java Runtime Environment is necessary to execute the .jar file. It has not been tested for all Linux distributions. The pdf files can be similarly extracted as described above.
